Opportunistic Screening in General Practice for Chlamydia trachomatis in Young Men

Hince, D A1, Arnold-Reed D E1, Brett T1, Mak D B2, Moorhead R1, Bulsara M1,3

1General Practice and Primary Health Care Research and 2Population and Preventative Health Domain, School of Medicine, University of Notre Dame Australia, Fremantle
3School of Population Health, Faculty of Medicine, Dentistry and Health Sciences, University of Western Australia

Background

- Little information available regarding the prevalence of genital Chlamydia trachomatis in young MEN in the general population.
- Community based rate of infection is estimated at 4.6% - over-representation of high-risk groups?1

Aims

1. Provide information on the prevalence of Chlamydia infection in young men presenting to General Practitioners
2. Assess behavioural factors associated with having the disease
3. Assess GP management of patients testing positive

Methods

Males 15-29 yrs presenting to GP FOR ANY REASON SYMPTOMATIC OR ASYMPTOMATIC

Informed consent

Brief questionnaire‡ + urine sample collection for Chlamydia testing (PCR)

Positive

Management by GP. GP phoned to answer questions on management

Negative

No further data collected from the GP

# of patients approached but refusing (with reasons if given)

Results

1. Chlamydia prevalence and behavioural factors:
   - 386/401 met inclusion criteria
   - AGE (mean (SD)) = 23.3 (3.9) yr.
   - 373/386 urine PCR results available.

Prevalence of Chlamydia = 3.8% (95% CI 2.1 to 6.2)

2. GP follow-up of positive cases:
   - 13/14 contacted by GP
   - 11 attended follow up consultation

Results cont...

- Figure below displays the % of participants who responded YES (indicating “risky” behaviour) to the sexual behaviour and genital symptoms questions as a function of PCR test results for Chlamydia.

Discussion and implications for practice

- Prevalence of Chlamydia lower than previous report
- Prevalence of self reported “risky” behaviours high.
- Little relationship between self reported sexual behaviour/symptoms and Chlamydia (but small n).
- Offer screening for all individuals??

Note: *one patient was treated with doxycycline; †an additional patient had previously been tested for HIV/Hep B

Table 1. Summary of GP management of positive Chlamydia cases.
